 Target-Directed Synthesis of Antibacterial Drug Candidate GSK966587
Org. Lett. **2010**, *12*, 3422–3425.

Synthesis of GSK966587

Significance: The eight-step synthesis of anti-bacterial agent GSK966587 (25% overall yield) required no protecting groups and involved only three isolated intermediates (**C**, **G** and **J**). Key steps were a Mizoroki–Heck reaction, a Negishi coupling, a directed *ortho*-metalation, and a Sharpless–Katsuki asymmetric epoxidation.

Comment: The directed *ortho*-metalation of naphthyridine **D** was strongly base-dependent. Problems included dianion formation, competing metalation at C6 as well as nucleophilic substitution of the fluorine atom. However, when (i-Pr)₂NZnEt₂Li was used as base, there was no dianion formation and only 4% metalation at C6 was observed.
