Divergent Synthesis of Tricyclic Biselenophene-Based Derivatives

**Significance:** While tricyclic bithiophene-based materials have been extensively studied as an important class of organic semiconductors, the corresponding biselenophene-based analogues have not been reported. Cheng and co-workers demonstrate for the first time that biselenophene can be utilized as starting material for the synthesis of a new class of both sp³-bridged and sp²-bridged tricyclic biselenophene-based materials.

**Comment:** The six brominated molecules highlighted above can be used as monomers to create a new class of p- or n-type polymers for exploring biselenophene-based materials in various opto-electronic applications, such as organic field-effect transistors and polymer solar cells.
