

## Syntheses of Sarcandrolide J and Shizukaol D

**Significance:** Liu and co-workers report the first syntheses of members of the family of lindenane sesquiterpenoid [4+2] dimer family of natural products. Despite their structural similarity, sarcandrolide J and shizukaol D were isolated from different plant species. The bioinspired synthetic strategy relies on a key Diels-Alder cycloaddition.

**Comment:** Diels-Alder reaction of dienophile **C** and the diene generated in situ from **D** yielded the desired diastereomer **F** in 83% yield. Intermediate **G** was subjected to singlet oxygen to afford **H** after Kornblum-DeLaMare rearrangement. Lactone methylation and acetylation completed the syntheses of sarcandrolide J and shizukaol D, respectively.
