

## Living Polymerization of Length-Controlled GNR

**Significance:** The living Suzuki–Miyaura catalyst-transfer polymerization (SCTP) is successfully applied to achieve length-controlled armchair graphene nanoribbons (GNR). The SCTP-enabled length control over the polymers is confirmed by the narrow polydispersity.

**Comment:** The armchair GNRs prepared via SCTP show both narrow dispersity and excellent yields. The great potency of the method is demonstrated with the acquirement of different polymer structures, including GNR block copolymers.
