Diversifying Amino Acids and Peptides via Deaminative Reductive Cross-Couplings Leveraging High-Throughput Experimentation

J. Am. Chem. Soc. **2023**, *145*, 5684–5695, DOI: 10.1021/jacs.2c11451.

Synthesis of Unnatural Peptides by Deaminative Reductive Cross-Coupling Reactions

Significance: Modification of peptides on the side chain of amino acid residues is very important in drug discovery and medicinal chemistry. The authors reported a deaminative reductive cross-coupling strategy to arylate the amino acid residues.

Comment: Various unnatural peptides are synthesized in moderate to good yields. The arylation of their side chains resulted efficiently from pre-formed amino acid pyridinium salts by using a nickel(II) catalyst.
